SCRUM & SCALED AGILE CLINIC

based on
Okaloa Flowlab simulations

Join this training and discover surprising new insights!

A lot of scrum and scaled agile implementations do not deliver the expected results. When scaling up agile, organizations get stuck in the complex dynamics of agile practices and the harsh reality. The Okaloa Flowlabs simulations allow participants to experience these problems from their own perspective and provide them with new insights.

Target audience & learning objectives:
This 2-day workshop is aimed at everyone who wants to broaden their agile knowledge and experience. The participants will develop an understanding about how to shape an agile organisation. They will experience how to get an agile organisation 'going'.

SCRUM SIMULATION

Many teams work with the scrum framework. But are these teams really 'agile'? In this simulation you will experience the problems AND solutions that many scrum teams know: different competencies in the team, problems with time-boxing, work in progress and cross-functionality.

MULTI-TEAM SIMULATION

Many organizations have to deal with multiple teams that work together on 1 product/service. What does this mean for the cooperation between these teams? What effect do the dependencies between teams have on lead time? How should you deal with capacity in a multi-team environment?

SCALED AGILE SIMULATION

Perhaps the most interesting simulation in an agile environment: the portfolio level. Does anything actually change for a portfolio manager in an agile organization? How do we match supply and demand here? And why are concepts such as triage and order points essential at this level?

facilitator: Patrick Steyaert
